

Solutions

1. What is Kanban and what can it do?

Kanban is a simple technique for tracking the progress of tasks through different activities. It uses index cards attached to a card board and different lists representing different activities. Cards can be physically moved between lists.

2. How does Kanban compare with Scrum?

Scrum has more structure, especially with fixed length sprints. Kanban achieves a similar goal with WIP (Work in process) limits that restrict the number of tasks being worked on at any one time.

3. What is Trello and what can it do?

Trello is an electronic version of a Kanban board. Different people create a Trello account using the Trello website. They can create teams, inviting other Trello users to join the team. Trello users and teams can create Trello Boards, which represent a project. These boards have different lanes and cards can be created in each lane. These cards can be moved between lanes. All team members involved are notified of these changes and the activities recorded.

4. How does Trello compare with Scrum?

Trello does not have many additional Scrum features. It is a useful way of letting everyone see the current state of the story cards.
