

Solutions

1. *What does the Product Owner do? How much are they involved in the day to day development?*

They provide the stories and ask questions about the stories as they are developed. They are present at the start and end meetings and are available to answer questions from the developers during the sprint.

2. *What does the Scrum Master do? How do they keep track of what developers do?*

The remove obstacles, mentor novices, liaise with customers. They find out what the developers are doing at the daily standup meetings, where each developer will speak..

3. *How are the stories for each iteration chosen?*

They are given priorities by the customer, and high priority stories are allocated to the early iterations. The stories for each iteration are conformed at the iteration start meeting.

4. *How is work allocated in Scrum?*

Stories are turned into several tasks and the developers choose which tasks to work on. Tasks are typically methods for various classes, and each class tends to have one developer who is responsible for it.

5. *How is progress tracked?*

A burndown chart records how much work is still to be done. It is adjusted at the end of each sprint. The estimated effort for each completed story is removed from the total, while any extra work discovered is added to the total.

6. *How are unexpected difficulties dealt with?*

Stories can be deferred to later iterations and low priority stories can be dropped.
